DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-3, 5-7, 10-12, 14 and 24-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kuettner et al. [US 5,852,866] in view of Ikeda et al. [US 5,492,856] and Folker et al. [US 5,777,539].

Kuettner et al. disclose an integrated inductor comprising:

- a spiral inductor metalization pattern [figure 3] including a plurality of parallel tracks [21] in a spiral pattern having a square configuration on a common layer, each track having first and second ends.

Kuettner et al. discloses the instant claimed invention except for: the metalization pattern being formed on a substrate and the first and second ends being connected together.

Ikeda et al. disclose a monolithic inductor being formed on a substrate.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to form the metalization patterns of Kuettner et al. on a substrate, as suggested by Ikeda et al., for the purpose of easily integrating the inductor.

Page 3

Application/Control Number: 09/493,942

Art Unit: 2832

Folker et al. disclose a spiral inductor metalization pattern [figure 2] having a plurality of conductor lines coupled together at their starting and end points.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to couple the end points of the conductors of Kuettner et al., as modified, as suggested by Folker et al., for the purpose of reducing the resistance of the winding.

Regarding claim 2, official notice is taken that a CMOS process is a well known method of producing an integrated inductor.

Regarding claim 6, Kuettner et al. and Folker et al. disclose multiple layers interconnected with vias [25].

Regarding claims 10-12, Ikeda et al. discloses the use of N+ diffusion layer directly beneath the metal layer [figure 2].

It would have been obvious to one having ordinary skill in the art at the time the invention was made to use the n+ diffusion layer for the purpose of generating a desired reverse bias and increasing the Q factor. The specific arrangement of the layer would have been an obvious design consideration based on the specific application and operating environment of the inductor.

3. Claims 4 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kuettner et al., as modified, as applied to claim 1 above, and further in view of Fawal et al. [US 6,049,258].

Kuettner et al., as modified, discloses the instant claimed invention except for the specific shape of the inductor metalization layers and the use of the inductor in transmission lines.

Regarding claim 4, Fawal et al. discloses the use of orthogonal shaped metalization layers.

Application/Control Number: 09/493,942

Art Unit: 2832

It would have been obvious to one having ordinary skill in the art at the time the invention was made to use the orthogonal shape of Fawal et al. in Kuettner et al., as modified, for the purpose of optimizing the sizing of the inductor.

Fawal et al. discloses the inductor being used for transmission lines.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to use the transmission design of Fawal et al. with the inductor design of Kuettner et al., as modified, for the purpose of optimizing the transmission network.

Response to Arguments

4. Applicant's arguments with respect to claims 1-12, 14-15 and 24-28 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Examiner Lincoln Donovan whose telephone number is (703) 308-3111.

The fax number for this Group is (703)308-7724.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703)308-0956.
